

From the right you see the y-pipe then the 2.5" ID to 3" OD coupler and then a 45 degree pipe. I used a 2.5" band clamp to attach the coupler to the y-pipe instead of a 2.5" u-bolt clamp. No particular reason why, I just did.

From the top you see the end of the 45 degree pipe then the straight pipe cut to length then another 45 degree pipe then another straight pipe cut to length then the 3" ID to 3" ID coupler then a piece of the u-bend pipe I had to cut to attach to the 90 degree pipe.

Here is a better picture of the piece I cut from the u-bend pipe mated up to the 3" ID to 3" ID coupler on the right and the 90 degree pipe above it.

This is a pic of the 90 degree pipe coming from over the axle at the top to the cutout. I had to cut a piece from the 'sleeve' end of a u-bend pipe to give the 90 degree pipe enough clearance over the axel.

This is a pic of the cutout (you can see the 90 degree pipe going over the axel at the left of the pic) with a piece of u-bend pipe heading to the muffler (top right of pic) and the exhaust reducer which goes to the passenger side exhaust pipe (center right of pic).

This is the driver side exhaust pipe. I used a 90 degree pipe out of the muffler followed by a piece cut from some left over straight pipe. I used one of the clamp hangers here. There was an existing hole in the 'framing' at the exact point to match up with where the 90 degree bend 'sleeved' over the scabbed straight pipe.

This is the passenger side exhaust pipe. From the left you can barely see the end of the exhaust reducer followed by a piece from a u-bend to a piece from left over straight pipe to the exhaust tip. This is where I used the other clamp hanger. I did have to bend up some of the metal edging that makes up the spare tire well. I also drilled hole in that edging to hang the clamp hanger.

And here is a picture of the rear end. I am not sure why the picture makes the passenger side seem like its really pointing 'outward'. It must be an illusion caused by the silver clamp hanger
